

# Acceptance & Maintenance Testing

## Independent Third Party Testing on All Manufacturers' Equipment

### Acceptance Testing

An essential method of assuring the reliability of any new facility is to perform proper Commissioning and Acceptance Testing prior to normal operation. This critical step will go a long way to protecting your capital investment in electrical equipment and provide the starting point for a comprehensive maintenance program.

The commissioning data obtained during Acceptance Testing provides the essential baseline for trending and comparison during future maintenance tests. Acceptance testing is done in accordance with manufacturer's recommendations, industry standards, IEEE/ANSI specifications, customer requirements, and with special attention to key safety issues.

### Maintenance Testing

*Dynamo Electric* combines comprehensive preventative maintenance programs with the science of predictive maintenance to achieve higher reliability and more cost-effective operations of electrical and control systems throughout your facility. Using the latest technology in test equipment and procedures, *Dynamo Electric* focuses on identifying factors that lead to equipment deterioration, trending them, and fixing them before they create unplanned downtime. This is a proven process that has allowed us to design and implement plans to improve system performance, reliability, and safety.
